Data Cleaning — Graphs & Charts Report

Visual summary based strictly on the figures and transformations documented in the supplied GitHub data-cleaning report.

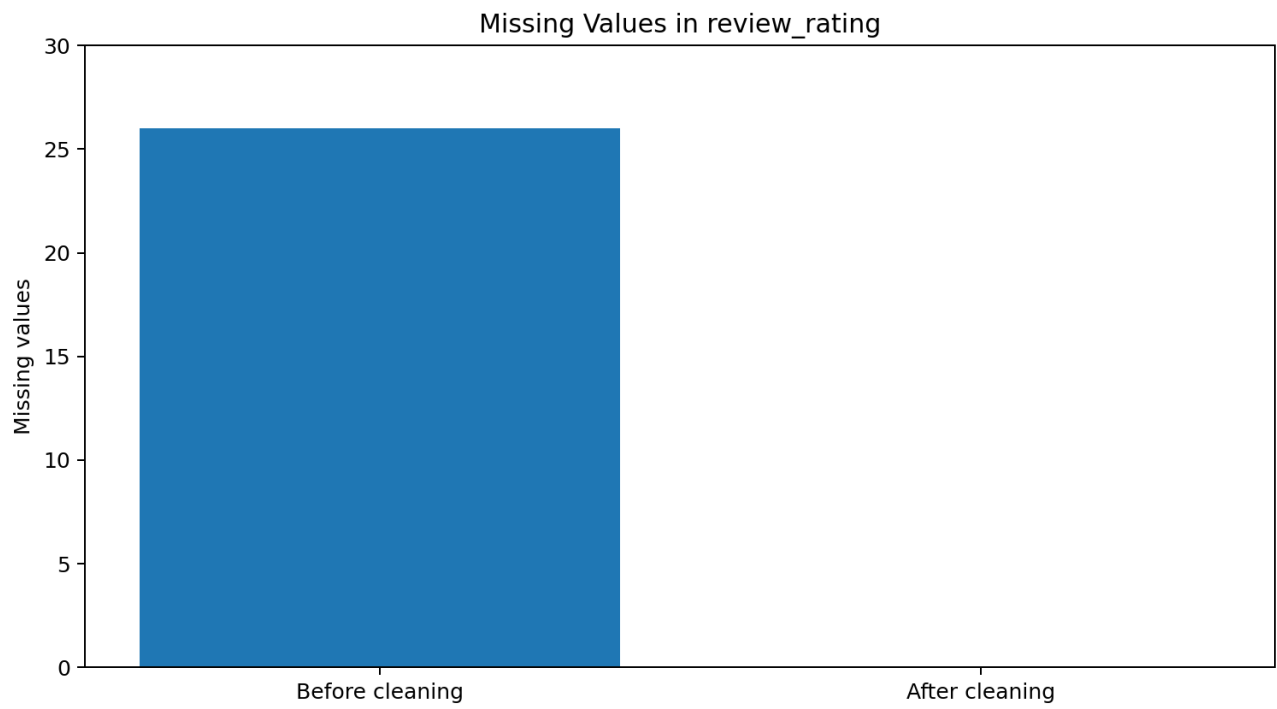

Metric	Before	After
Rows	500	500
Columns	17	18
Missing review_rating	26	0

1. Dataset Shape

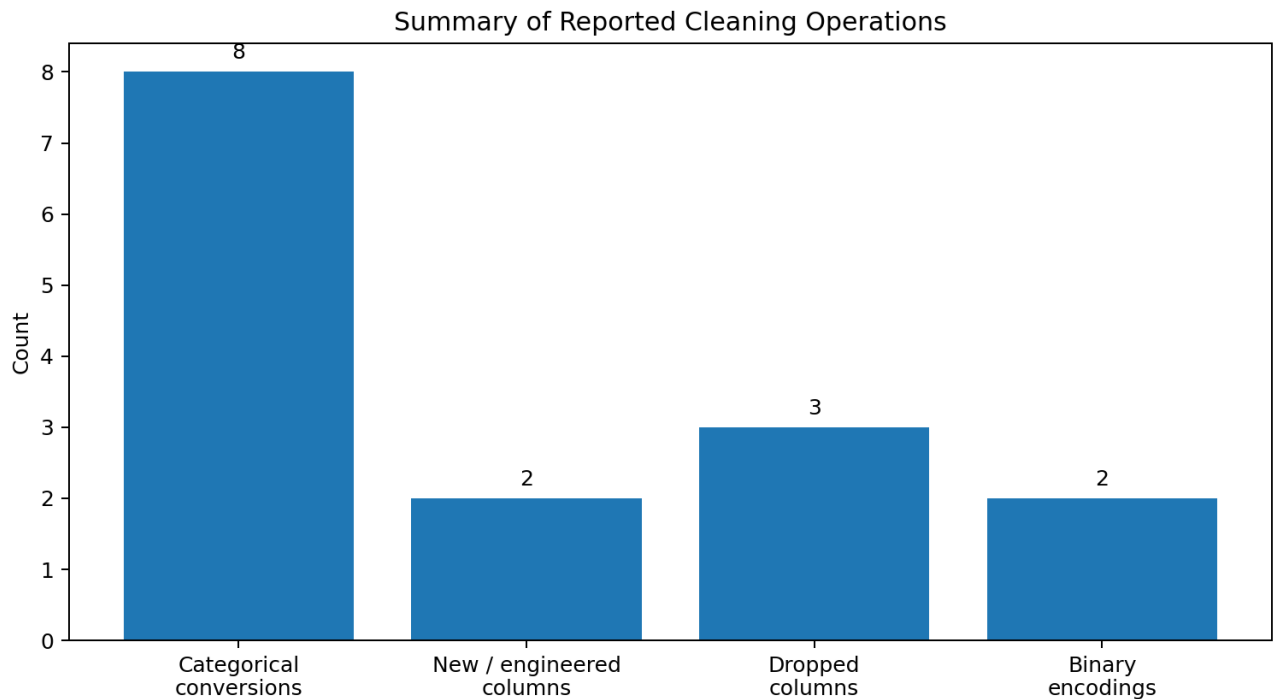

The report records 500 rows both before and after cleaning. The column count increases from 17 to 18 because engineered fields were added.

2. Missing-Value Correction

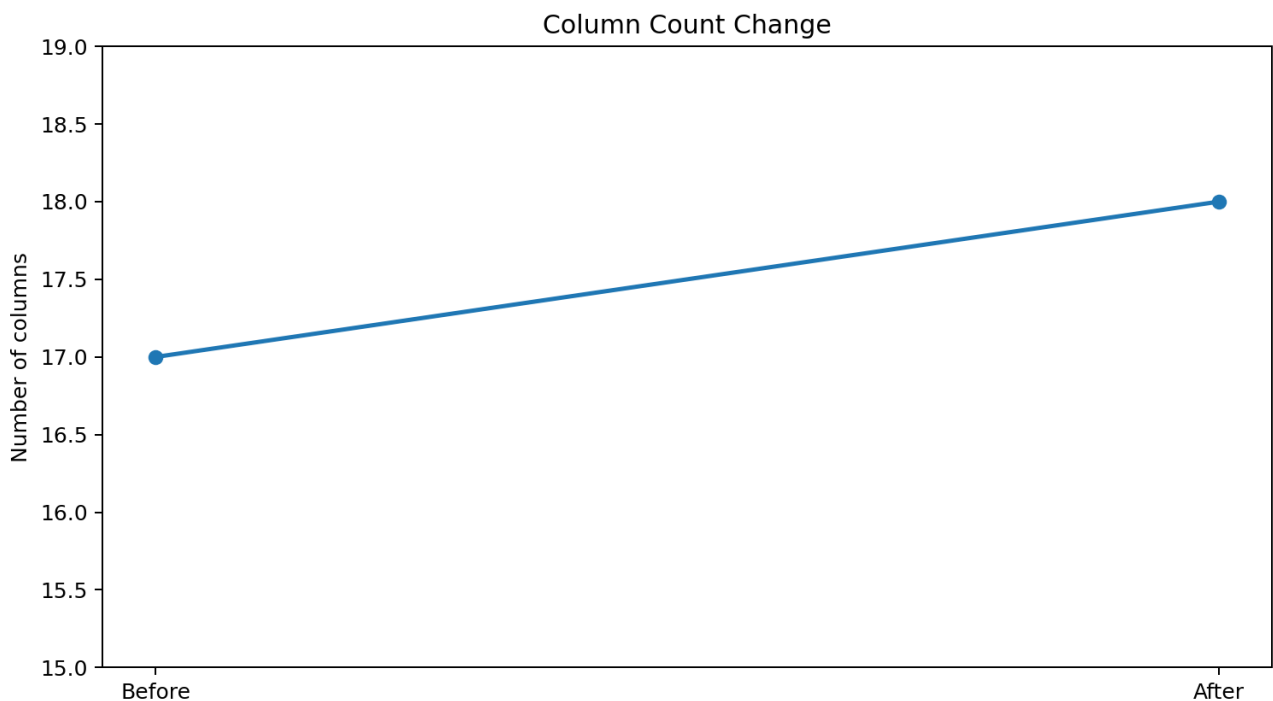

The only missing-value issue explicitly documented is review_rating: 26 missing values were reduced to 0 after cleaning.

3. Cleaning Operations

The report documents eight string-to-categorical conversions, two new/engineered columns, three dropped columns, and two binary encodings.

4. Column Count Change

The net result is one additional column: 17 columns before cleaning and 18 after cleaning.

5. Engineered & Transformed Fields

Category	Fields / transformation
Engineered	age_group; purchase_frequency_days
Binary encoding	subscription_status: Yes/No → 1/0; discount_applied: Yes/No → 1/0
Ordered categorical	size: S<M<L<XL; frequency_of_purchases: Annually<Monthly<Fortnightly<Weekly
Dropped	customer_id; size_encoded; purchase_frequency_encoded

Note: this PDF visualizes the metrics and transformations explicitly present in the cleaning report. It does not invent distributions for customer age, purchase amount, category, location, ratings, or other fields. Those charts require the underlying cleaned CSV.
